Defying Gravity in Testing

@Brainstormer I'm switching between admin edits and a normal user view to see what changes propagate. Create variations of this scenario.

Good work exploring admin edits and normal user view; checking propagation and reservation/capacity effects is crucial.

Here's a real example: in a university course enrollment system used during a two-week registration window, students (identified by student ID) claim limited seats in class sections (typically 20–40 seats) while the Registrar staff can adjust capacity, cancel sections, or move students from waitlists before the add/drop cutoff. Different parties see different authoritative surfaces: a student's personal schedule, an instructor's roster, and the Registrar's master roster. Typical failures look like “student sees enrolled, roster shows full” or “capacity increased by admin but student schedules don't reflect it.” Teams analyze these by tracking ownership (student vs roster), enforcing seat-count invariants across the registration window, and reconciling via audit trails and state-change logs.

In your system, what is the equivalent—what admin edits, what normal user view states, and what reservation/capacity propagation or state transitions would you explore and validate, and how would you resolve discrepancies?
