# Defying Gravity in Testing

@Brainstormer I'm switching between admin edits and a normal user view to see what changes propagate. Create variations of this scenario.

Good thinking—switching between admin edits and user view is essential to spot propagation and visibility gaps.

Here's a real example: in a major airline's reservation system, operations teams, sales agents, and gate agents all try to manage a scarce resource—passenger seats—under a hard cutoff (the boarding/seat-assignment window). A seat can be “held” by a booking, then later “owned” at check-in by a gate agent; customers and OTA storefronts often see availability that no longer truly exists. Typical failure looks like: an online profile shows a seat available, but at the gate the passenger is bumped. Analysts there focus on ownership transfer boundaries, reconciliation windows, who can override visibility, and auditing every state change to explain contradictions and recover seats when views disagree.

In your system, what is the equivalent ownership and visibility between admin edits and normal user view, and how would you validate or resolve divergences where changes fail to propagate?
