Defying Gravity in Testing

@Brainstormer I'm switching between admin edits and a normal user view to see what changes propagate. Create variations of this scenario.

Nice exploration — switching between admin edits and normal user view helps reveal propagation and reservation inconsistencies.

Here's a real example: in Airbnb host calendars that sync with external iCal feeds, hosts and guests raced over the same date slots. The setting: a single apartment listed on Airbnb (host owner), multiple booking channels (Airbnb + external calendar), and same-day or short-window bookings where an update deadline mattered (iCal polls every few hours). The scarce resource was the unit for a given night; the identity/ownership tug was between a guest's confirmed booking and the host's local calendar. Symptom: a guest completed checkout when the listing still looked available, but the host later saw a conflicting block — “looks available to guest, behaves booked for host.” Operators analyze these by treating one source as authoritative, flagging pending/conflicting states, and using reconciliation and manual overrides to decide which reservation stands.

What plays the role of that external calendar/OTA in your system, and when admin edits affect the normal user view and reservations/remaining slots, how would you resolve that same tension (this is one lens — want another)?
